

SECURITY ALERT

For New iMac 27"

Security Flaw: The iMac's power cord is unsecured allowing for the RAM panel to be easily opened. Once the iMac's power cord is removed it allows for easy access to the RAM ports subjecting it to theft and tampering. Standard universal cable locks only protect the theft of the device and provide no security to the power cable and it's inner components.

Solution: Our iMac Security Kit includes a specially designed steel security plate and iMac Cable Lock. The plate prevents removal of the power cord and access to the RAM panel, providing theft deterrent and tamper proof security.
