Hypersign Alert
Vital Information Fast!

Hypersign Alert allows you to administer visual alerts to digital signs and PC throughout a facility or campus when seconds count.

www.hypersign.com

Calling all network devices!

Hypersign Alert can synergize your systems with its IP-based, A/V mass notification system that can be pre-programmed to broadcast customized, multicast, rich media messages to any device on the network.

Mass notification alerts (intruder, severe weather, fire)

With a push of a button, Alert will commandeer all targeted endpoints (paging speakers, displays, computers, etc.) with a media-rich message that can include maps of escape routes and vital information.

Non-Emergency Alerts (to classrooms, office PCs, Hypersign displays)

Did you know you can use Hypersign Alert for non-emergency events? Imagine pushing a button and every PC screen and every digital sign in your facility is presented a full screen video message from the principal or company president. No application needs to be selected or kept open and "everyone" gets the message!

Easy to use web interface (powerful CMS puts you in control)

So now that you are convinced that you need a campus alert system, who is going to administer and manage it? With Hypersign Alert, anyone can. Our award winning interface allows the novice user to completely manage your Hypersign whether it is for general signage or an alert from a simple web browser.

The administrator creates the various building zones, defines the triggers (fire, security, etc.), and then uploads and associates the content (Powerpoint, graphics, scripts, video) for the notification. All applicable devices are equipped with "listeners" that respond instantaneously when a trigger is switched.
