OSP TapeTrack

The Trusted Tape Management Solution

OSP TapeTrack is a cross platform tape management solution that integrates natively with both open systems backup applications and mainframe tape management systems to provide an enterprise view of all removable media assets.

Compliant Movement Histories (SOX, PCI, SEC, FINRA, FACTA, GLB)
OSP TapeTrack records every activity relevant to the movement of a media volume permanently; even if the volume is deleted from OSP TapeTrack history, the information is still recoverable. Histories can be printed and given to auditors.

Service Level Reporting
OSP TapeTrack allows both retrospective and real-time service level reporting to ensure that all service level commitments have been and are being met. Full email integration means that any potential breach of service level agreements (SLA) can be corrected before they are a breach.

Complete Automation
OSP TapeTrack automates most library management tasks allowing you to focus your human resources on management by exception. This feature allows you to reduce your labor costs or reallocate staff to other non-library management roles.

Disaster Recovery (DR) Strategy
OSP Tape Track's DR Strategy synchronizes with your tape management software to identify the media needed to recover from a disaster. DR Strategy simplifies the disaster recovery process. When a disaster is declared, the DR Strategy allows OSP to quickly populate the picking list with the Disaster Recover volumes with one click of the mouse. OSP is then able to prepare and ship your tapes to you much faster, saving you valuable time in a disaster situation.

TapeTrack Master
Provides power users with the ability to manage their entire media library. Users can manage media using familiar technologies such as drag-and-drop and cut-and-paste. Users can also leverage the full power by creating Simple Management Rules to automate media cycling, and Data Clusters to logically define the library.

TapeTrack Lite
Provides users with an easy to follow Windows Wizard interface that allows them to send and retrieve media from an offsite vault. Users can set return dates or have Simple Management calculate the return dates automatically.

TapeTrack Sync
Provides a direct synchronization between most Tape Management Systems and the OSP TapeTrack framework including:

- Symantec Backup Exec
- Symantec NetBackup
- CommVault
- Tivoli Storage Manager (TMS)
- EMC Networker

- CA 1
- CA ARCserve
- RMM
- BRMS
- TLMS

TapeTrack Checkpoint
A unique speech-enabled picking and distribution allows vault librarians to handle tapes in real time without having to carry paper picking lists and without having to synchronize a PDT scanner. If a librarian finds a tape in the wrong location, it is scanned to hear the correct location for the tape.

KEY BENEFITS

Paperless Media Handling

Fast and Secure

Accurate, hands free

Automation

Supports all major backup software

Full Scalability

Full Library Visibility

Complete Compliance

Service Level Reporting

OSP TapeTrack

OSP TapeTrack

PROCESS

Customer uses tape to back up data

TapeTrack Lite
TapeTrack Sync
Assigns destination to tape

OSP picks up tape and transports it to OSP Tape Vault

TapeTrack Checkpoint
Tape is scanned In at OSP and assigned to slotted locations

TapeTrack Lite
TapeTrack Master
Customer can view full tape inventory, audit reports, store and access disaster recovery plans and request tapes for return

TapeTrack Sync
Triggers the return of expired tapes based on customer requiements

TapeTrack Master
TapeTrack Checkpoint
Locates and scans out tapes marked for return to customer. Tape is then transported to customer location

TapeTrack Lite
Tape is securely received at customers location
