

ScanIt

ScanIt is an easy-to-use reporting tool that helps Exchange administrators monitor the size and growth of Microsoft Exchange mailboxes. ScanIt is fully compatible with Exchange 2010, Exchange 2013, as well as Office 365, and can be easily configured on your workstation.

The ScanIt report, shown above, is presented in a web browser and can be downloaded for offline use. The top section of the report provides information about the global picture of your email system, including size totals and percentages of storage use for all messages and attachments, and a breakdown of how the total storage is being allocated.

The bottom portion of the report displays the details for selected mailboxes. The Search feature allows you to search through all the scanned mailboxes to view particular stats. For any selected mailbox, you will see the user's name and email address, the number of folders, attachments, messages, and attached messages that user has, a breakdown of the number of messages and attachments in the user's mailbox, and the total amount of storage taken up by the mailbox. For easier viewing, you can change the display order of the mailboxes according to user name, user email address, message size, attachment size, and total mailbox size.
