

A Company Profile

Introduction

Knowledgeone Corporation began life as GMB Solutions Pty Limited in August 1983, commencing commercial operations in April 1984. The Company name GMB came from the initials of the three original partners being **G**illett, **M**ckenna and **B**achmann. Mr Frank McKenna is the founder and is now the only one of the original three still involved with the company.

Frank is the Managing Director and CEO of the Australian Company and the President and CEO of the US Company. GMB Research & Development Pty Ltd was renamed as Knowledgeone Corporation in August 2005.

What do we do?

K1Corp designs, builds, installs and supports a range of innovative Knowledge Management and Enterprise Content Management (ECM) software applications. Our products apply to a wide range of application areas such as Records Management, Electronic Document Management, Document Imaging and Workflow. In the last 31 years K1Corp has brought 29 new products to market.

Cross Industry Products

K1Corp's products are installed in organizations in virtually every industry segment. We supply solutions to local government, federal government, defense, health, law enforcement, education, manufacturing, distribution, utilities, banking and finance.

There is no industry where our products don't fit and add value.

Solution Oriented Company

K1Corp has been producing Information Management products since the first DocFind in 1984. Today we are

one of the world's leading software innovators and have set industry standards for many years in Information Management, Records Management, Image Management, EDRMS, ECM, Business Process Management and Knowledge Management solutions.

With the release of Knowledgeone (K1) in 2005, we introduced the world to a totally new genre of information management product; one that totally empowered the customer. With RecFind 6 (the successor to K1) we have taken this to the next level and it is now even easier for the customer to quickly and easily change both the Data Model and Business Processes using the high level tool (the DRM) that comes free with RecFind 6.

In addition, RecFind 6 comes preconfigured 'out-of-the-box' with a number of almost ready-to-run applications including records management, document management, imaging, workflow, contract management, asset management, human resources management and customer relationship management. It can run multiple applications concurrently and is also dynamically multilingual – able to support multiple languages concurrently.

RecFind 6 also includes two optional add-ons in its suite of tools (GEM and RecCapture) that facilitate implementation of a fully automatic, rules-driven EDRMS. Both GEM and RecCapture are innovative new products incorporating a server-centric (no software to install on workstations), rules driven (expert system) and fully automatic (there is nothing for the user to do) paradigm for the selection, capture and classification of electronic documents and emails.

Products

- RecFind 6, the fully integrated EDRMS, includes all required EDRMS functionality - no additional modules required; includes RecFind 6 smart-client.
- RecFind 6 web-client, a browser based, zero footprint and zero maintenance client replicating the functionality and 'look and feel' of the smart-client.
- RecFind 6 DRM - Administrator's tool to change any aspect of RecFind 6.
- RecFind 6 Xchange - capture data from any source and integrate to any product.
- RecFind 6 Button - the world's easiest to use EDRMS tool for check-in, check-out, searching and scanning.
- RecFind 6 High Speed Scanning Module (HSSM) - totally automates high volume scanning jobs.
- RecFind 6 Mini API - allows any other product to use RecFind 6 as its document and image library.
- RecFind 6 GEM - fully automatic email management and archiving.
- RecFind 6 RecCapture - fully automatic EDRMS.
- RecFind 6 API/SDK – The program level interface to RecFind 6 functionality.
- RecFind 6 SharePoint Integration Module – a seamless way to fully integrate RecFind 6 with SharePoint.

Technology

K1Corp employs a variety of tools and technologies to build its products and provide solutions to its clients. In building products we use VB.NET, C#.NET, ASP.NET, C++, JavaScript, HTML, XML, etc. We use the most appropriate tool for the job. The architecture of RecFind 6 is based on the .NET paradigm with both 'smart' and 'web' clients. This means a rich windows or browser-based client that works equally well over the LAN or the Internet.

Integration

We have integrated to a host of 'foreign' products and application systems over the years. RecFind 6 comes with a free integration tool called Xchange that can connect to any application, database or data source and extract and capture data into the RecFind 6 repository. There literally isn't any product or system we can't integrate to using our Integration Toolset.

Development Partnerships

We have ongoing relationships with most major vendors and specific development partnerships with Microsoft, IBM/ Lotus and Novell. These partnerships are extremely important because they allow us to be knowledgeable and experienced in the latest releases, technologies, databases and operation systems. We

have for example, been a member of the Microsoft MSDN program since its inception.

Why deal with Knowledgeone Corporation?

- K1Corp has 31 years' experience in designing, developing, installing and supporting information management solutions.
- K1Corp has the robust, scalable and proven products that meet your management needs and significantly reduce the costs and risks associated with major EDRMS rollouts.
