Introduction

Our vision, at Unified Conferencing Technologies, is to create a robust, user-friendly, consistent, and feature rich collaboration experience for the conference room and beyond. We see a future where Unyfy brings disparate meeting/collaboration providers into a familiar user interface that allows the users of Unyfy to simply work with Unyfy, without regard for the underlying technologies/providers.

We also envision a future of affordable, commodity components providing extended capabilities such as voice & gesture recognition and integration with holographic presentations in virtual board/conference rooms. Imagine collaborating on a holographic document with holographic meeting attendees scattered around the room. And doing all that without regard for whether or not the meeting is a Skype for Business, Jabber, WebEx, Zoom.us or GoToMeeting meeting!

Of course, that vision is still on the horizon and there are many steps we need to take before getting there. However, our road map is designed to bring us closer with each release!

Q3/2015

- Supplant the Skype for Business/Lync user interface
 - Provide the base model to supplant all other meeting provider user interfaces
 - Support up to 8 active speakers with the current speaker in the middle
 - Configurable: bandwidth can be greatly impacted
- Organizer login for Skype for Business/Lync while in the conference room
 - Makes the conference room the "presenter" providing full meeting control
- More meeting information, such as attendee list and meeting details, in the "Details" view option from the ScheduleBar

Q4/2015

- Cisco Jabber integration into the user interface construct developed in Q3/2105
 - Extended "Custom Commands" to reflect Jabber integration
 - This will allow Unyfy to be driven off of Jabber in the same way in which it is today, driven off of Skype for Business/Lync
-

Q1/2016

- Contacts integration and enhancements
 - This will allow interaction with contacts from multiple repositories such as Exchange/Office 365/Skype/AD, Google Contacts/Plus and Jabber

Q2/2016

- Voice and Gesture recognition
 - Basic functionality release allowing:
 - Start meetings with voice commands
 - Selection meetings and scroll the UI with gestures
 - Order attendees with gestures
 - Only for Skype for Business and Jabber as they are in the new UI model

Q3/2016

- Zoom.us integration into the new UI model
- Enhanced functionality release for Voice and Gesture recognition
 - Driven largely off of the feedback from our user base but we envision support for commands like:
 - "Unyfy, Add Joe Smith the meeting"
 - Use gestures to manage screens and what is displayed on them
 - "Unyfy, Mute Lisa Noisy"
