

Introducing DashXML

Build
Analytic Apps
quickly and easily

An easier way to create custom analytical applications

Creating highly customized analytical applications has always been difficult. Application managers and developers had to choose between using BI platforms that limited their control over design and interaction. Or, use charting libraries and lose the power of the analytics platform, and ultimately require more development work.

Yellowfin and DashXML make it easy for developers to create analytical applications with less development work and unlimited flexibility. A win for developers and a win for applications managers.

DashXML is a Java Web application that communicates via Yellowfin's Web Services API to expose functionality such as reports, filters and security – while providing developers with complete freedom regarding design, layout and user interaction.

“We wanted a capable partner who could understand our needs, guide us through the process, and provide a solution that would meet the complex dashboard reporting requirements within an extremely tight timeline. We found that partner in Yellowfin.”

- Jeff Folckemer
President of Affiliate Relations & Technology LocalEdge

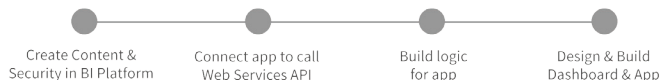

Less Development

Reduce development steps and get to market faster. Just create content in Yellowfin, then configure and style your application using DashXML.

Charting Library

BI Platform API

DashXML

Flexible

Enjoy the freedom to develop custom designs, layouts and interactions. DashXML leverages the power of Yellowfin, with the control and flexibility of a charting library.

Fantastic

Give your users a unique and stunning analytics experience with a serious wow factor. Looking to build a highly-customized consume-only analytics experience? Then DashXML is for you.
