

FOR IMMEDIATE RELEASE

Epstein Technologies Partners with H²D Software to Deliver Comprehensive NSA Chiropractic Office System

In today's chiropractic marketplace streamlined office organization is essential. It can now also be easy! Thanks to the collaborative efforts of Epstein Technologies and H²D Software, worrisome record keeping is no longer a burden. Announcing a new electronic record keeping system designed specifically for chiropractic offices utilizing Network Spinal Analysis Care.

Longmont, Colorado – December 18, 2015 - It's no secret that all too many doctors spend far too much of their time on paperwork, record keeping and administrative work when it can be better spent helping their patients. H²D Software and Epstein Technologies have paired their resources to transform that scenario. H²D Software has licensed the rights to create a comprehensive chiropractic office management software system that electronically tracks practice members' care.

"We are excited to work with Epstein Technologies to enhance Network care in offices around the world," commented Jenna Howard, Chief Operations Member of H²D Software. "With streamlined state of the art tracking of client care, doctors will have more time for serving their communities."

Dr. Donny Epstein, Epstein Technologies founder, also remarked on the new partnership and the value it delivers, "H²D Software is the first patient tracking system created specifically to serve Network care practices. Simultaneously recording and tracking multiple clinical parameters, interventions and outcomes, and having this available in a report – upgrades the results achievable while decreasing the record keeping burden. This software will even further enhance the outstanding benefits of Network care while helping provide the solutions required by our modern day health care system."

According to H²D Software, this cost effective system features technique specific treatment records to enhance clinical efficiency. The software is touch screen operated for easy in-office use and is tailored for the Network Spinal Analysis (NSA) protocol to enable doctors to create enhanced patient records with greater accuracy and efficiency.

Some of the highlights of this system include: simple controls and navigation; client care management; SOAP notes; full front desk integration; integrated billing and payments; scheduling and appointments; advanced reporting; and enhanced office management features.
