

Super Grip Lock

How it works

1. Turn Deadbolt handle to the locked position, slip the black elastic pocket or eyelet (located at the end of the Strap) over the Tip of the Deadbolt handle .
2. WRAP once around the *HANDLE* or *KEY* in the Direction required to lock Deadbolt go under the Doorknob lift up until Snug.
3. KEEP SNUG and FIRMLY PRESS the self-locking fabric together.

SUPER GRIP LOCK prevents the Handle from turning, which keeps the Bolt engaged so the Deadbolt cannot be unlocked until the Strap is removed.

WORKS on most Deadbolts at home and in motel rooms.

Easy to Modify

1. If your deadbolt locks on the inside with a key simply turn the key to the locked position then slip the Elastic Pocket over the key and wrap the fabric around the key in the direction required to lock your deadbolt go under the doorknob or lever handle lift up until snug and firmly press the fabric together. It's simple to do and we recommend you use a heavy duty key. If you buy a new key make sure it fits into the black Elastic Pocket - before you buy it.
2. If your deadbolt was NOT installed using the standard deadbolt/doorknob template then the distance between the deadbolt and doorknob will usually be greater than the standard distance. In this case: Super Grip Lock may need to be lengthened and it's simple. Press on 6 inches of 1-inch wide double-sided hook & loop fabric found at your local fabric store to the end of the Strap with the length of fabric you need to secure the deadbolt handle in the locked position.
3. If your deadbolt turn-handle is smaller than normal it can slip out of the Elastic Pocket. In this case, simply make a small slit in the center of the Strap 1/2 inch below the Triangle Eyelet then fit the tip of the deadbolt handle into the slit, then holding the fabric in place; wrap as directed; it's easy to do just be careful when making the slit.
