D3 Security Receives IBM PartnerWorld's Ready for IBM Security Intelligence Validation

Vancouver, BC, CANADA (Jan 5th, 2016) – D3 Security, a leading cyber incident response and digital forensics case management provider, today announced it has received IBM PartnerWorld's *Ready for IBM Security Intelligence* designation for its Incident Response and IT Forensics Case Management modules. As a result, D3 Security's Incident Response and IT Forensic Case Management modules have been validated to integrate [IBM Security QRadar](#) and IBM X-Force threat intelligence to help better protect customers around the world.

"D3's Cyber Security Incident Response platform is designed to automate a company's incident response playbook by creating and assigning tasks and notifications based on industry best practices," said Gordon Benoit, President, D3 Security. "Our IT Forensic Case Management solution allows investigators to acquire data, manage the case, track the physical evidence and analyze digital evidence to such an extent that it can be presented in a court of law."

"The integration with IBM QRadar Security Intelligence Platform allows our mutual customers to synchronize up-to-the-minute events with their incident response team and have visibility into the team's progress. We are very excited about the integration and having IBM as a Business Partner will be beneficial to both companies moving forward," said Benoit.

D3 Security's Cyber Security Incident Response Software streamlines and automates the reporting, investigation and analysis of cyber security incident reports such as privacy breaches, malware infection and distributed denial of service attacks (DDoS). The system's highly configurable incident management platform allows organizations to proactively create intelligence-gathering processes and workflows in response to known threats while also giving the flexibility needed to capture new events and their details on-the-fly. Security teams use the D3 system to extract maximum intelligence from simulated, resolved and in-progress events—in turn saving precious time, facilitating best practices adoption and mitigating liability in an inevitable future attack or privacy breach.

The IT Forensics Case Management Software is a highly specialized, web-based solution that manages computer, mobile and network investigations from inception through resolution. The foundation of the system are its four central components—Web Intake, Case Management, Evidence Tracking and Transparency Reporting—which are configured using the logic and workflows of highly experienced IT Forensic Investigators from global organizations. These invaluable task-management tools track and report across all of the standard data retrieval and processing tasks associated with each custodian while also providing case-requestors with much needed transparency into case-process. From the acquisition of devices and data, secure collaboration and producing nightly transparency reports, to data analysis and courtroom-ready reporting, the Investigation Case Management Software has been built to support the expanding roles of computer forensic investigators, computer security and litigation support professionals at organizations around the globe.

The Ready for IBM Security Intelligence alliance is designed to promote technology collaboration and integration to expand and enhance security coverage, collapse silos of information, and increase situational awareness and insights. With the PartnerWorld program

and Ready for Security Intelligence validation, IBM supports collaboration with its Business Partners to enable the integration of product capabilities and improved security capabilities for mutual customers.

About D3 Security

D3 Security is the global provider of an award-winning software suite that is fundamentally changing the way incidents and compliance requirements are managed and resolved in the enterprise. Combining Incident Response and IT Forensic Case Management into a single easy-to-manage platform, D3 gives users the power to consolidate disparate data, identify the root cause of incidents and apply corrective action – in any department or industry. Engineered for flexibility and configured to meet the customer's exact needs, D3 is used to streamline reporting and compliance requirements by the world's largest organizations, including over 100 companies of the Fortune 500.
