

Simple, Sophisticated, Scalable User-centered, Manageable, Solutions

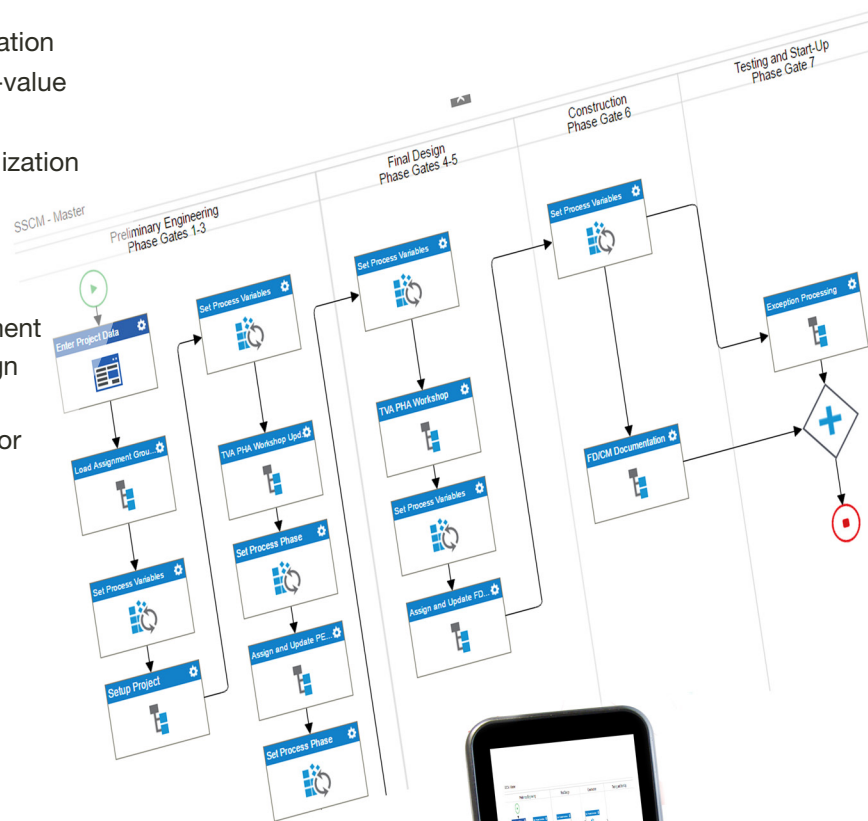

Let us help you launch a solution pilot in under six weeks using a cloud, on premise or hybrid deployment.

Consider the Value of:

- Reducing process variation
- Eliminating low or non-value added services
- Improving resource utilization
- Reducing cycle times

Sample services:

- Current State Assessment and Future State Design
- Project Management
- Implementing an OTB or customized solution
- Training and support

“Many cost reduction opportunities will actually improve outcomes.”

- HBR, Michael Porter 2013

We know Safety and Security

For more than a decade, our consultants have worked with clients as project managers, developers, architects, and strategic advisors. Our deep specialized knowledge allows us to quickly deliver advanced technical solutions while always keeping our eye on business value. We have a track record of successful projects in the transportation industry. Our solutions are currently helping clients design, build, and operate safe and secure transit in communities around the northwest.

Our Solutions

Keep you in Compliance

Our solutions are built around the primary goal of keeping you in full compliance. They are based upon the guidelines set forth in the FTA Handbook for Safety and Security Certification, FTA Circular 5800.1, MAP-21 and the FAST Act, and incorporate recommendations from APTA, FRA, and various State Safety Oversight Agencies. You can rest easy knowing that compliance is taken care of, and that every aspect of our solution is geared towards effortless reporting and easy auditing.

Handle your Documents

Actively managing your documents, instead of just storing them, can open a whole new world of possibilities. Users are quick to see the benefits of accessing documents when and where they want, and quickly making changes. Our systems keep checklists, certificates, reports, blueprints, and other documents right where you need them, with automatic tagging to painlessly provide search and filter functionality. Take advantage of versioning and co-editing features to cut down on email attachments, keeping all the information and history related to a document in one place. And of course, rely on our robust security features to keep them protected at all times.

Help your Team Work Together

A lot of different people access your safety and security system for a lot of different reasons. Executives want to see high level system views and reports, managers need to grant approvals, contractors enter information and provide documents, while many others have their own personal interactions. With our solutions, it's easy for everyone to work together efficiently. We'll allow you to track changes whenever and wherever they happen, customize automatic alerts, collaborate on documents with versioning and co-editing, create automatically generated and custom reports, and of course track approvals and associated comments. We design our solutions to be flexible, allowing you not only to accommodate all these different roles, but also adapt quickly when things inevitably change.

Manage Safety and Security Items

You use your item list a lot, so you need it to work the way you want it to. We allow you to track items through all project phases, while keeping supporting information, metadata, and related documents close at hand. See the history of each item along with its current status and related tasks. Easily create views and filters to ensure that the right people get exactly the information they need at the right time.

Guard Sensitive Information

Any system is worthless if it can't keep your information secure. We have deep experience creating systems to handle sensitive security information, as well as many other types of confidential information. We know how to make it easy and safe for those with authorization to access the information they need while keeping everyone else out.

Promote Change Management

Take the pain out of change management by tracking updates to open items whenever and wherever they occur, automatically storing change information right alongside each item and/or document. Update to new processes easily while retaining the old ones for reference. Easily make changes to views, reports, and documents for the entire organization, or just one person.

Support your Entire Project Lifecycle

From preliminary engineering through design and construction to revenue operations, different project phases require different approaches to managing information. Our systems automatically adapt to your project lifecycle. Items that are created during preliminary engineering or final design can still be tracked, with all their related metadata and documents, during revenue operations. Meanwhile closed items, completed tasks, and extraneous information can be automatically removed from view when no longer relevant.

And there's no need to ever worry about project size, since our solutions are designed to scale. Use the same system to tackle your largest and smallest projects and expect the same top-level performance.
