# Chat eDiscovery 2.6

Designed to produce distinct chat transcripts
allowing efficient and rapid reviews

**What?**

Chat eDiscovery is a software solution, trusted by service providers and in-house eDisocvery teams, used to pre-process instant messaging data, such as Bloomberg, Skype or Lync.

**Why?**

The review of Instant messaging data in its original format can be challenging and in some cases even impossible. Chat eDiscovery produces distinct chat transcripts that can be loaded into any eDiscovery review system enabling the reviewers to find and focus on the relevant information first and be more efficient than ever before.

**How?**

Chat eDiscovery can be licensed for usage in your own environment on-premise, or Forexus will process the data in its cloud solution.
