

Dimodelo Architect Fact Sheet

Data Warehouse Automation

Design and Build a Data Warehouse Fast!

Dimodelo Architect dramatically reduces the effort required to design, build, deploy and run a Data Warehouse. Deliver the benefits of a data warehouse at the speed of self-service BI.

Dimodelo Architect captures your Data Warehouse design, generates the code, handles deployment, and runs the ETL.

BI professionals stay focused on delivering valuable and impressive Reporting and Analytics... instead of being stuck in Data Warehouse code.

“In a matter of 1 hour, I have been able to use Dimodelo to perform the transformations and additional metrics I wanted, deployed and tested in UAT. This would have taken me the best part of 2 days traditionally” - Nigel Rablin. Business Intelligence Specialist.

Case Study

Dimodelo Solution recently built a Data Warehouse for an Aged Care client in 29 days yielding 28 Dimension and 13 Facts. The effort included gathering requirements, developing the Data Warehouse and ETL using Dimodelo Architect, creating a cube with several complex measures, implementing the ETL workflow and deploying to a UAT environment.

Dimodelo Solutions mentored the client through the development process providing hands on training to their Business Intelligence developers.

Dimodelo Architect ROI

In real life implementations Dimodelo Architect has been proven to reduce development time by 65%.

On average 6.4 hours in total per dimension/fact. That's analyzed, designed, built, tested, scheduled and deployed to production.

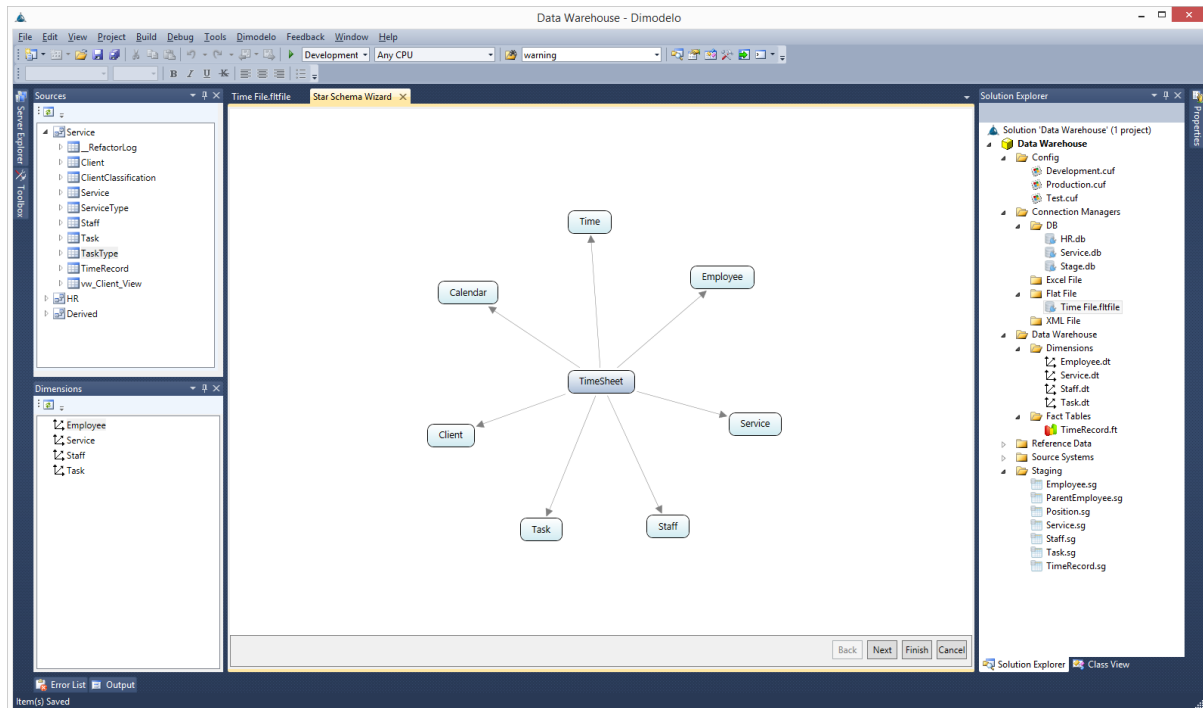

Dimodelo Architect will more than pay for itself in the first iteration of your project.

The Data Warehouse is delivered earlier, and those savings continue in subsequent iterations and maintenance.

Dimodelo Architect is Risk Free!

Dimodelo Architect generates standard SQL and SSIS code. If, for any reason, you decide to not to continue using Dimodelo Architect, your developers can simply continue on coding, modifying the SQL and SSIS directly.

About Dimodelo Architect

Dimodelo Architect is a Data Warehouse Automation tool for the Microsoft SQL Server platform. Use Dimodelo Architect to design, generate, deploy and run a Data Warehouse. Dimodelo Architect captures your entire Data Warehouse design in a single Visual Studio project, then generates the staging and data warehouse databases, and high performance, industry best practice SSIS Packages. Dimodelo Architect manages the deployment of the solution to a server, and the execution of ETL batches.

Be truly agile

Dimodelo Architect allows you to be truly agile. Respond to changing business requirements and iterate quickly through releases. Simply change a column, data type, mapping, expression etc., and re generate. Your change is propagated throughout the code.

Dimodelo Architect supports SQL Server 2008, 2012, 2014 and 2016.
