

What can InDoc do for your emergency department or health system?

One TeleTriage physician can cover multiple EDS simultaneously.

Example	ED volume 60,000	ED volume 50,000	ED volume 40,000
What are the potential savings in a system with the following three emergency departments?	3% LWBS	2% LWBS	1% LWBS
	40 minute D:D	35 minute D:D	30 minute D:D
	175 minute LOS	165 minute LOS	150 minute LOS

TeleTriage often decreases Door to Doctor times by 75% or more.

\$ 1 Million

Door to Doctor time is directly linked to liability risk. A 75% reduction in Door to Doctor time would reduce the expected number of annual claims by two-thirds.

TeleTriage typically reduces Left Without Being Seen rates by a half to two-thirds.

\$ 1.5 Million

A reduction in the Left Without Being Seen rate by 50% would result in an additional 1,500 revenue-generating patients for the system annually.

TeleTriage frequently reduces the Length of Stay of discharged patients by 15 to 45 minutes.

\$ 16.5 Million

A 10% reduction in Length of Stay would result in an additional 41,000 bed hours of capacity across the three emergency departments, this is the equivalent of 16,500 patients- without the need to increase staffing.

Hospitals that implement TeleTriage can see a 4-point improvement in overall Press Ganey scores.

Priceless

Press Ganey scores are highly predictive of overall HCAHPS scores. A 4-point Press Ganey improvement equates to movement from the 33rd to 67th percentile. This is often an immediate and sustained improvement.
