

Free Webinar on Robotic Good to Person Order Fulfillment System

Conveyco Technologies a leading North American systems integrator, is providing a free 40-minute webinar demonstrating the latest robotic automated storage and retrieval system providing flexible labor and throughput rates, high density storage, and a rapid deployment.

The system’s flexibility allows the system to grow and contract based on actual and projected volume. In fact, additional Skypod autonomous mobile robots (AMRs) can be leased to meet peak periods. Designed for reliability, every Skypod robot is centrally monitored 24/7/365 to assure peak performance and uptime.

The webinar details how the system is comprised of rack, totes, software, and the 3-axis Skypod AMR (autonomous mobile Robot). The Skypod robots navigate to the correct bin and then travels vertically up to 36’ to extract the tote and deliver it to the correct workstation.

“This is the most revolutionary material handling automated storage and retrieval system to be developed in decades,” said Ed Romaine former chairman of MHI’s automated storage and retrieval product section group. He continued, “The flexibility, density, reliability and overall simplicity of this hybrid AMR system makes this a no-brainer for ecommerce, omnichannel, micro-fulfillment centers, retail and D2C manufacturers.”

By watching the webinar, you will learn how this system provides a fast return on investment, performs at benchmark speeds and mitigates order fulfillment performance issues especially during peak activity times.

Conveyco Technologies has been providing world class performance enhancements for order fulfilment, distribution centers and warehouse operations for over 40 years. Solutions and systems include sortation, voice, pick-to-light, palletizing, AS/RS, automated case handling, autonomous mobile robots (AMRs), robotic picking, dispensing, AGVs, WES, WMS and WCS software plus consulting and integration services.
