## New Product Announcement – High Precision Arbitrary Waveform Generators

The models 675 and 676 are highly versatile Arbitrary Waveform Generators that do not compromise on the specifications required for demanding applications and solutions. These models can generate several functions (sine, sawtooth, square, and more) as well as arbitrary waveforms at a high rate and accuracy. They have variable sample rates of 1.2 and 2.5 GS/s respectively with a 14 bit resolution, and an analog bandwidth of 1GHz.

With the ability to easily design sophisticated waveforms through the 7” touch-screen interface, these ARB generators will prove to be worthwhile investments, transferable across a diverse set of project environments. Trial availability pending.

Founded in 1963, Berkeley Nucleonics constantly aims to improve and iterate upon its ever-increasing library of Test and Measurement instruments. Our line of products can be found in research, medical, business and military environments around the world, well regarded for their longevity and versatility.
