ULTRA

Ultra HyperSpike® Announces New Speaker Estimate Tool

HyperSpike®, a product of Ultra, in partnership with [Reusser Design](#) have developed an online tool to calculate the number of speakers needed for sufficient acoustic coverage within a defined area. The new [Speaker Calculator](#) is just one of several acoustic modelling and estimation tools available to HyperSpike® customers.

Conveniently located on ultra-hyperspike.com or within the HyperSpike® Mobile Application, users can easily calculate estimated speaker needs for basic fire and life safety applications and projects. When project planners or customers are on-site, or in-need of a quick-turn estimate, the HyperSpike® Speaker Calculator provides instant results. The application also provides convenient access to specification documents and the ability to email the estimate report to multiple recipients or HyperSpike® representatives.

Patrick Allison, Vice President of Business Development Commented:

"One of the most coveted HyperSpike® values is the ability to deliver superior acoustic coverage with a minimum quantity of speakers. The Speaker Calculator provides our partners and customers the power to estimate the cost-saving benefits of a HyperSpike® solution in the palm of their hand."

About the HyperSpike® Mobile Application

The HyperSpike® Mobile Application modernizes the demonstration experience with simple user interface and features for remote control of the device. Whether wired to the speaker device or connected via a Bluetooth receiver, the application will provide the acoustic tools necessary for clear and authoritative communication. The HyperSpike® Mobile Application with [Speaker Calculator](#) is available at no cost through [Google Play](#) or iTunes.
