The eMurmur® software system is a digital auscultation platform for the healthcare provider. eMurmur® is used to stream, record, display, replay, and store the acoustic auscultation signal, acquired from a growing list of compatible digital stethoscopes.
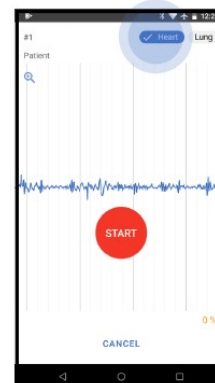

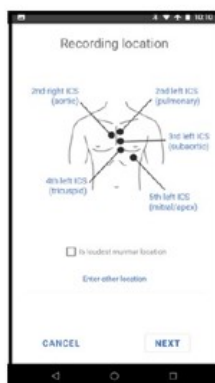

The eMurmur platform is hardware neutral and runs on iOS, Android and common browsers, making it the first open and widely accessible auscultation technology.

eMurmur's digital records enable providers to evaluate patients' conditions over time, as well as consult with colleagues either in or outside of the examination setting.
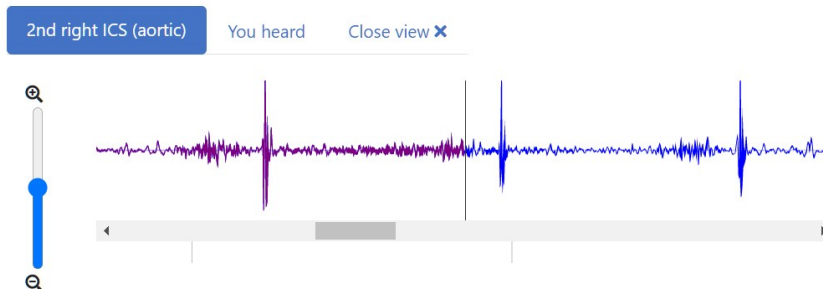

Using advanced engineering, eMurmur® makes it possible for healthcare providers to screen, monitor, diagnose and consult on heart, lung and bowel irregularities with greater certainty.

Livestream or Record and Share Files
