SSID Group Announces New Systems Development Methodology Project

Release Date: October 17, 2022

Systems Solutions Innovation Design Group, LLC

<https://www.SSIDGroup.com>

Lenoir City, TN (PRWEB): Systems Solutions Innovation Design Group, LLC (SSID Group) today officially announced the establishment of the Dynamic Secure Systems Engineering Methodology (DS2EM) project.

There are two issues that have been a serious problem for many years related to systems development, the failures of systems development projects and the growing number of security breaches. For decades, research organizations have been compiling and reporting statistics and other information about these problems. Many of these research studies have reported a list of causes with suggested solutions to help mitigate the problems. "However, systems development projects continue to fail," said Gary Harris, Ed.S, Managing Director, "and the number and severity of security breaches continue to go up." The same identified causes in these research reports keep recurring year after year. Many years of research and development efforts have been expended on studying these issues. SSID Group suggests that the recurring causes and growing number of security breaches is due to inadequate systems development methodologies.

SSID Group's solution to these problems is the development of the Dynamic Secure Systems Engineering Methodology (DS2EM). The new development methodology will have several elements designed into it to reduce or eliminate problems that have been encountered in previous development projects. DS2EM will embrace simplicity, common sense, and solid and flexible processes. In addition, it will have security and risk mitigation features designed into the methodology to drastically reduce security breaches.

SSID Group will not be seeking funding for the project. The project will be self-funded. "If the project is not successful, it is on us." said Gary Harris, Ed.S, Managing Director, "However, if the methodology is successful, it will benefit many organizations globally by reducing project failures, development costs, security breaches, and other issues." SSID Group will market one of its business assets to fund the project - the domain name of a multi-billion dollar global industry.

When completed, SSID Group will be publishing the DS2EM methodology and standards, creating curriculums to teach the methodology, and develop a system to help manage DS2EM projects. Organizations will easily be able to take advantage of its many features and benefits.

Systems Solutions Innovation Design Group, LLC is a growth-oriented professional systems and services firm. The mission of SSID Group is to advance and provide quality systems, business, and education consulting and solutions.
